

Deskfolio Prompt Guide

A generic, reusable prompt template for feeding your personal details into a book-style Deskfolio portfolio project (built on the FeralUI DeskFolio component) using an AI coding assistant.

What this guide is for

Deskfolio-style projects present your portfolio as a small interactive book that blooms open from a closed cover and turns its pages using spring-physics animation. Inside, it typically holds **About**, **Skills**, **Projects**, and **Contact** sections, built as React components (the original component library is **FeralUI**, at feralui.dev/deskfolio). A personal fork such as “Megha-Deskoflio” wires real personal content into that book shell.

This guide gives you a single, fill-in-the-blanks master prompt. You collect your own details once, paste them into the template, and hand the finished prompt to an AI coding assistant (Claude Code, Claude in your IDE, Cursor, etc.) pointed at the cloned repository. The assistant then edits the project's data/config files and JSX/TSX content to reflect you — instead of the original author.

Boilerplate repo: use this project as your starting point —
<https://github.com/Meghamittal0920/Megha-Deskoflio.git>

Note: This is a **generic guide** built from the public FeralUI DeskFolio component description. Before running the prompt, open the actual repo's **src/data** or **content** folder yourself (structure may vary slightly between forks) so the AI can be pointed at the right files.

How to use this guide

- **Step 1** — Fill in your details using the checklist below.
- **Step 2** — Copy the Master Prompt template and replace every [BRACKETED] field with your info.
- **Step 3** — Clone the repo locally, open it in Claude Code / your AI coding tool, and paste the completed prompt.
- **Step 4** — Use the follow-up mini-prompts to iterate (add a project, change theme colors, add a resume link, etc.).

Step 1 — Gather Your Details

Have this information ready before you write the prompt. You don't need everything — skip fields that don't apply and remove them from the template.

Category	What to prepare
Identity	Full name, professional title/tagline, pronouns (optional), profile photo file
About / Bio	2–4 sentence bio, your story/mission, current role & location
Skills	Grouped skills (e.g. Languages, Frameworks, Tools, Design) with optional proficiency level
Projects	For each project: name, 1–2 line description, tech stack, live link, repo link, cover image
Experience/Education	Company/School, role/degree, dates, 1-line summary (if the template has this section)
Contact	Email, phone (optional), location/timezone
Social Links	GitHub, LinkedIn, X/Twitter, Instagram, personal site, Dribbble/Behance, etc.
Resume	Link to hosted PDF resume, or file to add to /public
Branding	Preferred accent color(s), font preference, light/dark default, favicon

Tip: draft this in a plain text file or note app first. You'll paste chunks of it directly into the Master Prompt in Step 2.

Step 2 — The Master Prompt Template

Copy everything in the box below into your AI coding assistant, replacing every [BRACKETED] field with your own details. Delete any section you don't need.

You are working inside my cloned Deskfolio project (a React portfolio built as an interactive book, using the FeralUI DeskFolio component: it blooms open from a closed cover and turns pages with spring-physics animation, with About / Skills / Projects / Contact sections).

Goal: Replace all placeholder / sample-author content in this repository with MY real personal details below, while keeping the existing animations, layout, styling system, and component structure intact. Do not change the book-opening or page-turn physics unless I ask.

=== MY DETAILS ===

IDENTITY

- Full name: [YOUR FULL NAME]
- Title / tagline: [e.g. Frontend Developer | UI Engineer | Student]
- Location: [CITY, COUNTRY]
- Profile photo: [path to image file OR "use a placeholder for now"]

ABOUT / BIO

[Write 2-4 sentences about who you are, what you do, and what you're currently focused on]

SKILLS (grouped)

- Languages: [e.g. JavaScript, TypeScript, Python]
- Frameworks/Libraries: [e.g. React, Next.js, Tailwind CSS]
- Tools/Platforms: [e.g. Git, Figma, Docker, AWS]
- Other: [e.g. UI/UX design, public speaking]

PROJECTS (repeat this block for each project)

1. Name: [PROJECT NAME]

Description: [1-2 lines about what it does and the problem it solves]

Tech stack: [React, Node.js, MongoDB, ...]

Live link: [URL or "none"]

Repo link: [URL or "none"]

Cover image: [path or "use a placeholder"]

EXPERIENCE / EDUCATION (only if this template has that page)

- [Company / School] – [Role / Degree] – [Start-End dates]

[1-line summary of what you did/learned]

CONTACT

- Email: [YOUR EMAIL]
- Phone: [OPTIONAL]
- Availability note: [e.g. "Open to freelance work" / "Open to internships"]

SOCIAL LINKS

- GitHub: [URL]
- LinkedIn: [URL]

- X / Twitter: [URL or remove]
- Other: [Dribbble / Behance / personal site / remove]

RESUME

- [Link to hosted resume PDF, or "add my resume.pdf from /path, link it from the contact page"]

BRANDING PREFERENCES

- Accent color: [hex code or description, e.g. "deep purple, #6C4FDC"]
- Font preference: [keep existing / suggest a clean sans-serif]
- Default theme: [light / dark / follow system]
- Favicon: [use my initials / keep existing]

=== INSTRUCTIONS FOR YOU (THE AI ASSISTANT) ===

1. Find where content currently lives (likely a /data, /content, or /constants folder, or directly inside the page/section components). Show me the relevant file paths before editing if you're unsure.
2. Replace sample text, sample projects, sample images, and sample links with my details above. Keep placeholder assets only where I marked "use a placeholder".
3. Preserve existing component structure, animation logic, and styling conventions – only touch the data/content layer and any obviously hard-coded personal info.
4. If skills/projects are rendered from an array or JSON/TS object, update that data source rather than duplicating markup.
5. Update page <title> and meta tags (description, OG image alt text) to reflect my name and title.
6. After editing, run the project locally and tell me the command to preview it, and flag any file (e.g. resume PDF, profile photo) I still need to add manually.
7. Summarize every file you changed at the end.

Step 3 — Running It Against the Repo

- Clone the boilerplate project: `git clone https://github.com/Meghamittal0920/Megha-Deskoflio.git` then `cd` into it.
- Install dependencies: `npm install` (or `pnpm install` / `yarn`, matching the repo's lockfile).
- Open the folder in Claude Code (or your editor's AI assistant) so it has file read/write access.
- Paste the completed Master Prompt from Step 2 as your first message.
- Review the diff/changes it proposes before accepting — especially for config files.
- Run the dev server (commonly `npm run dev`) and check the book opens, pages turn, and your content appears correctly on each page.

Step 4 — Useful Follow-Up Mini-Prompts

Once the base content is in, use these short prompts to iterate:

Add a new project

Add a new project to the Projects page: name "[NAME]", description "[TEXT]", tech stack [LIST], live link [URL], repo link [URL], cover image [PATH]. Follow the same data structure as the existing projects.

Change the color theme

Change the accent color used across the book (cover, buttons, highlights) to [HEX CODE / color name]. Keep contrast accessible in both light and dark mode if both exist.

Swap the profile photo

Replace the placeholder profile photo with the image at [PATH], adjusting any cropping/aspect-ratio styles so it still fits the existing photo frame.

Add resume download

Add a "Download Resume" button on the Contact page linking to [PATH or URL], opening in a new tab.

Update contact form behavior

Wire the contact form to [e.g. mailto:, Formspree endpoint, EmailJS] so submitted messages reach [YOUR EMAIL].

Add a new page/section

Add a new section called "[SECTION NAME]" as another page in the book, positioned after "[EXISTING SECTION]", containing: [CONTENT].

Notes & Troubleshooting

- **Repo structure varies by fork** — personal forks of DeskFolio may rename folders or move data into a single config file. Ask the AI assistant to locate the content source first if unsure.
- **Images** — AI assistants can't generate your real photos; add image files to the project's /public or /assets folder yourself, then reference the path in your prompt.
- **Large edits** — for a big repo, ask the assistant to update one section at a time (Identity/About first, then Skills, then Projects, then Contact) rather than everything at once.
- **Keep a backup** — commit your working repo (or create a branch) before running a large content-replacement prompt, so you can easily revert.
- **Credit** — if you keep using the FeralUI DeskFolio component, check its license/attribution requirements on feralui.dev before publishing your portfolio.

Generated as a reusable template — fill in your details and adapt file/folder names to match your actual repository structure.
